#### Abstract

The purpose of this paper is to introduce a new kind of generalization of principally quasi injective Ssystems over monoids (PQ-injective), (and hence generalized quasi injective), namely pseudo principally quasi injective S-systems over monoids. Several properties of this kind of generalization are discussed. Some of these properties are analogous to that notion of pseudo principally quasi injective class of general modules. Sufficient conditions are given for pseudo principally quasi injective $S$-systems to be principally quasi-injective and pseudo quasi principally injective $S$-systems. Characterizations of pseudo principally quasi injective Ssystems are considered.

Keywords: Pseudo injective S-systems; Pseudo principally quasi injective S-systems over monoids; principally quasi injective S-systems; fully pseudo stable S-systems; fully stable S-systems.

## 1- Introduction and Preliminaries :

Throughout this paper, the basic S-system is a unitary right S-system with zero which is consists of a monoid with zero, a non-empty set $M_{s}$ with a function $\mathrm{f}: \mathrm{M} \times \mathrm{S} \rightarrow \mathrm{M}$ such that $\mathrm{f}(\mathrm{m}, \mathrm{s}) \mapsto \mathrm{ms}$ and the following properties hold (1) $\mathrm{m} \bullet 1=\mathrm{m} .(2) \mathrm{m}(\mathrm{st})=(\mathrm{ms}) \mathrm{t}(3) \mathrm{m} 0=\Theta$ for all $\mathrm{m} \in \mathrm{M}$ and $\mathrm{s}, \mathrm{t} \in \mathrm{S}$, where 0,1 is the zero, identity element of S and $\Theta$ is the zero element of $M$. In case a non-empty subset $N$ of an $S$-system $M_{s}$ such that $x s \in N$ satisfies for all $x \in N$ and $s \in S$ , then $N$ is called a subsystem of $M_{s}$. Let $A_{s}$ and $B_{s}$ be two $S$-systems. A mapping $g$ : $A_{s} \rightarrow B_{s}$, such that $g(a s)=g(a) s$ for all $a \in A_{s}$ and $s \in S$ is called an $S$-homomorphism [2]. An $S$-congruence $\rho$ on a right $S$-system $M_{s}$ is an equivalence relation on $M_{s}$ such that whenever $(a, b) \in \rho$, then (as, bs) $\in \rho$ for all $s \in S$. The identity S-congruence on $M_{s}$ will be denoted by $I_{M}$ such that $(a, b) \in I_{M}$ if and only if $a=b[3]$. The congruence $\psi_{M}$ is called singular on $M_{s}$ and it is defined by a $\psi_{M} b$ if and only if $\mathrm{ax}=\mathrm{bx}$ for all x in some $\cap$-large right ideal of $\mathrm{S}[1]$. For S -system $\mathrm{M}_{\mathrm{s}}, \mathrm{H} \subset \mathrm{S}, \mathrm{K} \subset \mathrm{M} \times \mathrm{M}, \mathrm{T} \subset$ $M, J \subset S \times S:(1) \ell_{M}(H)=\{(m, n) \in M \times M \mid m x=n x$ for all $x \in H\}(2) \gamma_{s}(K)=\{s \in S \mid$ as $=$ bs , for all $(a, b) \in$ $K\}(3) \gamma_{s}(T)=\{(a, b) \in S \times S \mid t a=t b$ for all $t \in T\}(4) \ell_{M}(J)=\{a \in M \mid a m=a n$ for all $(m, n) \in J\}[4]$.

If an S-system $A_{s}$ is generated by one element, then it is called principal system and it is denoted by $A_{s}=<u>$, where $u \in A$, then $A_{s}=u S([5], P .63)$.The authors defined that if for every $x \in M_{s}$, there is an S-homomorphism $f: M_{s} \rightarrow$ $x S$ such that $x=f\left(x_{1}\right)$ for $x_{1} \in M_{s}$, then an $S$-system $M_{s}$ is called principal self-generator [6] . An S-system $B_{s}$ is a retract of an $S$-system $A_{s}$ if and only if there exists a subsystem $W$ of $A_{s}$ and epimorphism $f: A_{s} \rightarrow W$ such that $B_{s} \cong W$ and $f(w)=w$ for every $w \in W$ ([5],P.84). An S-homomorphism f which maps an S-system $M_{s}$ into an S-system $N_{s}$ is said to be split if there exists $S$-homomorphism $g$ which maps $N_{s}$ into $M_{s}$ such that $f g=1_{N}[3]$.

Let $M_{s}, N_{s}$ be a right $S$-systems. An S-system $E$ is called injective if for every S-monomorphism $f: M_{s} \rightarrow N_{s}$ and every S-homomorphism $g: M_{s} \rightarrow E$, there is an S-homomorphism $h: N_{s} \rightarrow E$ such that $h f=g$ [10]. A right Ssystems $\mathrm{N}_{\mathrm{s}}$ is called $\mathbf{M}$-injective if for each S -monomorphism from S -system $\mathrm{B}_{\mathrm{s}}$ into S -system $\mathrm{M}_{\mathrm{s}}$ and every homomorphism g: $\mathrm{B}_{\mathrm{s}} \rightarrow \mathrm{N}_{\mathrm{s}}$, there is S-homomorphism
$h: M_{s} \rightarrow N_{s}$ such that $h f=g$. Thus $N_{s}$ is injective if and only if $N_{s}$ is M-injective for all S-system $M_{s}$ [14] .
In [10], P.Berthiaume had studied injective S-systems. Then the concept of injectivity on S-systems is generalized to quasi injectivity by A.M.lopez, such that an S -system $\mathrm{N}_{\mathrm{s}}$ is quasi injective if $\mathrm{N}_{\mathrm{s}}$ is N -injective [1]. Also, in [13], T.Yan introduced the concept of pseudo injectivity as a generalization of quasi injectivity. An S-system $M_{s}$ is called pseudo-injective if each S-monomorphism of a subsystem of $M_{s}$ into $M_{s}$ extends to an S-endomorphism of $M_{s}$. It is well
known from above that every quasi injective $S$-system is pseudo injective, but the converse is not true in general and we gave an example which illustrated this fact.

At the same time, for another generalization of injectivity, we have: An S-system $M_{s}$ is called principal injective system (C-injective) if for any $S$-system $B_{s}$, any principal subsystem $C$ of $B_{s}$ and any homomorphism from C into $M_{s}$ can be extended to $S$-homomorphism $g$ from $B_{s}$ into $M_{s}$ [9]. As a proper generalization of quasi injective $S$ system, we introduced principally quasi injective $S$-system and some definitions relevant to our work. An $S$-system $M_{s}$ is called principally quasi injective system (this means PQ-injective) if $M_{s}$ is PM-injective [6].

The present work consists of two sections. The first one is devoted to introduce and investigate a new kind of generalization of principally quasi injective $S$-systems, namely pseudo principally quasi injective $S$-systems over monoids. Certain class of subsystems which inherit the property of pseudo principally quasi injective have been considered. Also, characterizations of this new class of S-systems was investigated. Example is given to illustrate that pseudo PQ-injective S-systems are not PQ-injective. Some known results on pseudo PQ-injective for general modules were generalized to S -systems. In the second section, we try to put some light on relation of pseudo PQ-injective Ssystems with other classes of injectivity such as PQ-injective by using the concepts of fully stable, fully pseudo stable and pseudo $M_{s}$-projective and then we find conditions to versus pseudo PQ-injective S-systems with PQ-injective and pseudo QP-injective S-systems.

## 2-Pseudo Principally quasi Injective S-Systems:

(2-1)Definition: An S-system $N_{s}$ is called pseudo principally M-injective(for short pseudo PM-injective) if for each S-monomorphism from a principal subsystem of an S-system $\mathrm{M}_{\mathrm{s}}$ into $\mathrm{N}_{\mathrm{s}}$ can be extended to S-homomorphism from $\mathrm{M}_{\mathrm{s}}$ into $N_{s}$. An S-system $M_{s}$ is called pseudo principally quasi injective if it is pseudo principally M-injective (if this is the case, we write $\mathrm{M}_{\mathrm{s}}$ is pseudo PQ-injective ).

## (2-2) Remark and Example:

(1) Every PQ-injective (and hence quasi injective) $S$-system is pseudo PQ-injective. But the converse is not true in general, for example, let $S$ be the monoid $\{1, a, b, 0\}$ with $a b=a^{2}=a$ and $b a=b^{2}=b$. Now, consider $S$ as a right $S$ system over itself, then the only non-trivial principal subsystems of $S_{s}$ are $a S=\{a, 0\}$ and $b S=\{b, 0\}$. It is easy to check that $S_{s}$ is pseudo PQ- injective. But, when we take $N=\{a, 0\}$ be principal subsystem of $S_{s}$ and $f$ be $S$-homomorphism defined by $f(x)=\left\{\begin{array}{ll}0 & \text { if } x=0 \\ b & \text { if } x=a\end{array}\right\}$, then this $S$-homomorphism cannot be extended to $S$-homomorphism $g: S_{s} \rightarrow S_{s}$. If not, that is there exists S-homomorphism $g: S_{s} \rightarrow S_{s}$ such that $g(x)=f(x), \forall x \in N$, which is the trivial S-homomorphism(or zero homomorphism), since other extension is not S-homomorphism. Then, $b=f(a)=g(a)=a(0)$ which implies that $b=$ $\mathrm{a}(0)$, and this is a contradiction .
(2) Retract of pseudo PQ-injective system is pseudo PM-injective.

Proof: Let $\mathrm{M}_{\mathrm{s}}$ be pseudo PQ -injective S -system and N be a retract cyclic subsystem of $\mathrm{M}_{\mathrm{s}}$. Let A be principal subsystem of $M_{s}$ and $f: A \rightarrow N$ be S-monomorphism. Define $\alpha\left(=j_{N} o f\right): A \rightarrow M_{s}$, where $j_{N}$ is the injection map of $N$ into $M_{s}$, so $\alpha$ is S-monomorphism. Since $M_{s}$ is pseudo PQ-injective system, so there exists S-homomorphism $\beta: M_{s} \rightarrow M_{s}$ such that $\beta 0 i_{A}=\alpha$, where $i_{A}$ be the inclusion map of $A$ into $M_{s}$. Now, let $\pi_{N}$ be the projection map of $M_{s}$ onto $N$. Then, define $\sigma\left(=\pi_{N} \beta\right): M_{s} \rightarrow N$. Thus we have that $\sigma o i_{A}=\pi_{N} o \beta o i_{A}=\pi_{N} \mathrm{o} \alpha=\pi_{N} \mathrm{oj} j_{N} \mathrm{of}=\mathrm{f}$. Therefore, an S-homomophism $\sigma$ is extends $f$ and $N$ is pseudo PM-injective S -system.
(2-3) Lemma: Every pseudo PM-injective subsystem of S-system $M_{s}$ is a retract of $M_{s}$.
Proof: Let $\alpha$ be S-monomorphism from a principal subsystem $N$ of $S$-system $M_{s}$ into $M_{s}$ and $I_{N}$ be the identity map of $N$ . Then, pseudo PM-injectivity of N implies that there exists S -homomorphism g: $\mathrm{M}_{\mathrm{s}} \rightarrow \mathrm{N}$ such that $\mathrm{I}_{\mathrm{N}}=$ go $\alpha$, hence $\alpha$ is a retraction. Therefore $N \cong \alpha(N)$ is a retract of $M_{s}$.
(2-4)Proposition: Let $M_{s}$ be S-system. If $N_{s}$ is pseudo PM-injective, then $N_{s}$ is pseudo PA-injective system for anyprincipal subsystem A of $\mathrm{M}_{\mathrm{s}}$.
Proof: Let X be principal subsystem of principal subsystem A of $\mathrm{M}_{s}$, and let f be any S-monomorphism of X into Ssystem $N_{s}$. Let $i_{X}\left(i_{A}\right)$ be the inclusion map of $X(A)$ into $A\left(M_{s}\right)$ respectively. Since $N_{s}$ is pseudo PM-injective, then there exists S-homomorphism $\mathrm{g}: \mathrm{M}_{\mathrm{s}} \rightarrow \mathrm{N}_{\mathrm{s}}$ such that $\mathrm{goi}_{\mathrm{A}} 0 \mathrm{oi}_{\mathrm{X}}=\mathrm{f}$. Define S -homomorphism h by h(=goi $\left.\mathrm{A}_{\mathrm{A}}\right): \mathrm{A} \rightarrow \mathrm{N}$, then, $\forall \mathrm{x} \in$ A we have $h(x)=h\left(i_{X}(x)\right)=\left(\operatorname{goi}_{A}\right)\left(\mathrm{i}_{\mathrm{X}}(\mathrm{x})\right)=\left(\operatorname{goi}_{\mathrm{A}} \mathrm{O} \mathrm{i}_{\mathrm{X}}\right)(\mathrm{x})=\mathrm{f}(\mathrm{x})$, which implies that h extends f and $\mathrm{N}_{\mathrm{s}}$ is pseudo PAinjective system.
(2-5) Theorem: Let $M_{1}$ and $M_{2}$ be two S-systems. If $M_{1} \oplus M_{2}$ is pseudo PQ-injective .Then $M_{i}$ isPM $\mathrm{j}^{-}$injective (where $\mathrm{i}, \mathrm{j}=1,2$ ).

Proof: Let $M_{1} \oplus M_{2}$ be pseudo PQ-injective. Let A be principal subsystem of $M_{2}$, and $f$ an S-homomorphism from A into $M_{1}$. let $j_{1}$ and $\pi_{1}$ be the injection (and projection) map of $M_{1}$ into $M_{1} \oplus M_{2}\left(\right.$ and $M_{1} \oplus M_{2}$ onto $\left.M_{1}\right)$. Define $\alpha: A \rightarrow$ $M_{1} \oplus M_{2}$ by $\alpha(a)=(f(a), a), \forall a \in A$. It is clear that $\alpha$ is S-monomorphism. Since $M_{1} \oplus M_{2}$ is pseudo PQ-injective, so by proposition (2-4), $\mathrm{M}_{1} \oplus \mathrm{M}_{2}$ is pseudo $\mathrm{PM}_{2}$-injective. Hence, there exists $S$-homomorphism $g$ from $\mathrm{M}_{2}$ into $\mathrm{M}_{1} \oplus \mathrm{M}_{2}$ such that goi $=\alpha$. Now, put $h\left(=\pi_{1} \circ g\right): M_{2} \rightarrow M_{1}$. Thus $\forall a \in A$, we have hoi $(a)=\pi_{1} \operatorname{ogoi}(a)=\pi_{1} o \alpha(a)=\pi_{1}(\alpha(a))=$ $\pi_{1}(f(a), a)=f(a)$. This means $M_{1}$ is $\mathrm{PM}_{2}$-injectiveS-system.
(2-6) Corollary: Let $\left\{M_{i}\right\}_{i \in I}$ be a family of S-systems, where I is a finite index set. If $\oplus_{i \in I} M_{i}$ is pseudo PQ-injective , then $M_{j}$ is pseudo $P M_{K}$-injective system for all $j, k \in I$.
(2-7) Lemma: Let $\left\{N_{i}\right\}_{i \in I}$ be a family of S-systems, where $I$ is a finite index set. Then, the direct product $\Pi_{i \in I} N_{i}$ is PM-injective if and only if $N_{i}$ is PM-injective for every $i \in I$.

Proof : $\Rightarrow$ ) Assume that $N_{s}=\Pi_{i \in I} N_{i}$ is PM-injective $S$-system. Let $X$ be principal subsystem of $M_{s}$, f an Shomomorphism of $X$ into $N_{i}$, and $\varphi_{i}, \pi_{i}$ be the injection and projection map of $N_{i}$ into $N_{s}$ and $N_{s}$ onto $N_{i}$ respectively . Since $N_{s}$ is PM-injective, so there exists S-homomorphism g: $\mathrm{M}_{\mathrm{s}} \rightarrow \mathrm{N}_{\mathrm{s}}$ such that goi $=\varphi_{\mathrm{i}}$ of , where i be the inclusion map of $X$ into $M_{s}$. Then, define $h\left(=\pi_{i} o g\right): M_{s} \rightarrow N_{i}$ such that hoi $=\pi_{i} o g o i=\pi_{i} \circ \varphi_{i} o f=f$. Thus $N_{i}$ is PM-injective Ssystem.
$\Leftarrow$ ) Assume that $\mathrm{N}_{\mathrm{i}}$ is PM-injective for each $\mathrm{i} \in \mathrm{I}$. Let X be principal subsystem of $\mathrm{M}_{\mathrm{s}}, \mathrm{f}$ an S -homomorphism of X into $N_{s}$ and $\varphi_{i}, \pi_{i}$ be the injection and projection maps of $N_{i}$ into $N_{s}$ and $N_{s}$ onto $N_{i}$ respectively. Since $N_{i}$ is PM-injective Ssystem, so there exists S-homomorphism $\beta_{i}: M_{s} \rightarrow N_{i}$ such that $\beta_{i} o i=\pi_{i}$ of, where $i$ be the inclusion map of $X$ into $M_{s}$. Now, define an S-homomorphism $\beta\left(=\varphi_{i} \circ \beta_{\mathrm{i}}\right): \mathrm{M}_{\mathrm{s}} \rightarrow \mathrm{N}_{\mathrm{s}}$, then $\beta \mathrm{oi}=\varphi_{\mathrm{i}} \mathrm{o} \beta_{\mathrm{i}} \mathrm{oi}=\varphi_{\mathrm{i}} \circ \pi_{\mathrm{i}} \circ \mathrm{of}=\mathrm{f}$. Therefore, $\mathrm{N}_{\mathrm{s}}$ is PM-injective system.
(2-8) Corollary: For any integer $n \geq 2, M_{s}^{n}$ is pseudo PQ-injective if and only if $M_{s}$ is PQ-injective system.
Let $M_{s}$ be $S$-system. For all element $m \in M_{s}$, with $\alpha \in T=\operatorname{End}\left(M_{s}\right)$,define :
$A_{m}=\left\{n \in M_{s} \mid \gamma_{s}(n)=\gamma_{s}(m)\right\} ;$
$S_{(\alpha, \mathrm{m})}=\{\beta \in \mathrm{T} \mid \operatorname{ker} \beta \cap(\mathrm{mS} \times \mathrm{mS})=\operatorname{ker} \alpha \cap(\mathrm{mS} \times \mathrm{mS})\} ;$
$B_{\mathrm{m}}=\left\{\alpha \in \mathrm{T} \mid \operatorname{ker} \alpha \cap(\mathrm{mS} \times \mathrm{mS})=\mathrm{I}_{\mathrm{mS}}\right.$.
(2-9) Proposition: Let $M_{s}$ be an $S$-system with $T=\operatorname{End}\left(M_{s}\right)$, the following conditions are equivalent for an element $\mathrm{m} \in \mathrm{M}_{\mathrm{s}}$ :
(1) $M_{s}$ is pseudo principally injective (pseudo PM-injective),
(2) $A_{m}=B_{m} \cdot m$,
(3) If $A_{m}=A_{n}$, then $B_{m} \cdot m=B_{n} \bullet n$,
(4) For every S-monomorphism $\alpha: \mathrm{mS} \rightarrow \mathrm{M}_{\mathrm{s}}$ and $\beta: \mathrm{mS} \rightarrow \mathrm{M}_{\mathrm{s}}$, there exists $\sigma \in \mathrm{T}$ such that $\alpha=\sigma o \beta$.

Proof: $(1 \rightarrow 2)$ Let $n \in A_{m}$, this implies $A_{m}=A_{n}$, hence $\alpha: m S \rightarrow M_{s}$ defined by $\alpha(m s)=n s, s \in S$. Let $\mathrm{ms}_{1}=\mathrm{ms}_{2}$, this implies $\left(\mathrm{s}_{1}, \mathrm{~s}_{2}\right) \in \gamma_{\mathrm{s}}(\mathrm{m})=\gamma_{\mathrm{s}}(\mathrm{n})$, then $\mathrm{ns}_{1}=\mathrm{ns}_{2}$. Hence, $\alpha\left(\mathrm{ms}_{1}\right)=\alpha\left(\mathrm{ms}_{1}\right)$ and $\alpha$ is well-defined and for the reverse steps, we obtain that $\alpha$ is $S$-monomorphism, so by (1), there exists an $S$-homomorphism $\beta \in T$ extends $\alpha$. Then, $\forall \mathrm{m} \in \mathrm{M}_{\mathrm{s}}$, we have $\beta(\mathrm{m})=\alpha(\mathrm{m})=\mathrm{n}=\beta \cdot \mathrm{m}$, so $\beta \in \mathrm{B}_{\mathrm{m}}$ [In fact, if (ms, mt) $\in \operatorname{ker} \beta \cap(\mathrm{mS} \times \mathrm{mS})$, then $\beta(\mathrm{ms})=\beta(\mathrm{mt})$ and ms $=\mathrm{mt}$. So, $\left.\operatorname{ker} \beta \cap(\mathrm{mS} \times \mathrm{mS})=\mathrm{I}_{\mathrm{mS}}\right]$. Conversely, if $\beta \bullet \mathrm{m} \in \mathrm{B}_{\mathrm{m}} \bullet \mathrm{m}$, then $\beta \in \mathrm{B}_{\mathrm{m}}$, that is $\operatorname{ker} \beta \cap$ $(\mathrm{mS} \times \mathrm{mS})=\mathrm{I}_{\mathrm{mS}}$. It is obvious that $\gamma_{\mathrm{s}}(\mathrm{m}) \subseteq \gamma_{\mathrm{s}}(\beta \mathrm{m})$, since for $(\mathrm{r}, \mathrm{s}) \in \gamma_{\mathrm{s}}(\mathrm{m})$, we have $\mathrm{mr}=\mathrm{ms}$, since $\beta$ is welldefined, so $\beta(\mathrm{mr})=\beta(\mathrm{ms})$. Thus, $\beta(\mathrm{m}) \mathrm{r}=\beta(\mathrm{m}) \mathrm{s}$ which implies that $(\mathrm{r}, \mathrm{s}) \in \gamma_{\mathrm{s}}(\beta \mathrm{m})$. Now, if $\beta(\mathrm{mr})=\beta(\mathrm{ms})$ and (mr, ms$)$ $\in \operatorname{ker} \beta \cap(\mathrm{mS} \times \mathrm{mS})=\mathrm{I}_{\mathrm{mS}}$, then $\mathrm{mr}=\mathrm{ms}$ and $(\mathrm{r}, \mathrm{s}) \in \gamma_{\mathrm{s}}(\mathrm{m})$. Hence, $\gamma_{\mathrm{s}}(\beta \mathrm{m}) \subseteq \gamma_{\mathrm{s}}(\mathrm{m})$. Then, $\gamma_{\mathrm{s}}(\beta \mathrm{m})=\gamma_{\mathrm{s}}(\mathrm{m})$. Therefore, $\beta \mathrm{m} \in \mathrm{A}_{\mathrm{m}}$.
$(2 \rightarrow 3)$ Let $A_{m}=A_{n}$. Then, $A_{m}=B_{m} \cdot m, A_{n}=B_{n} \bullet n . S o, B_{m} \cdot m=B_{n} \cdot n$.
$(3 \rightarrow 4)$ Let $\alpha: m S \rightarrow M_{s}, \beta: m S \rightarrow M_{s}$ be S-monomorphisms. Then, $\gamma_{s}(\beta \mathrm{~m})=\gamma_{s}(\alpha \mathrm{~m})$. Since, for $(\mathrm{s}, \mathrm{t}) \in \gamma_{\mathrm{s}}(\beta \mathrm{m})$, then $\beta(\mathrm{ms})=\beta(\mathrm{mt})$. Since $\beta$ is monomorphism, so $\mathrm{ms}=\mathrm{mt}$. Since $\alpha$ is well-defined, so $\alpha(\mathrm{ms})=\alpha(\mathrm{mt})$. This means $\gamma_{s}(\beta \mathrm{~m}) \subseteq \gamma_{\mathrm{s}}(\alpha \mathrm{m})$. In similar way, we can find $\gamma_{s}(\alpha \mathrm{~m}) \subseteq \gamma_{\mathrm{s}}(\beta \mathrm{m})$, thus $\gamma_{\mathrm{s}}(\beta \mathrm{m})=\gamma_{\mathrm{s}}(\alpha \mathrm{m})$, which implies $\mathrm{A}_{\alpha \mathrm{m}}=\mathrm{A}_{\beta \mathrm{m}}$ ,then by(3) $B_{\alpha m} \alpha m=B_{\beta m} \beta m$. Since $\operatorname{kerI}_{M} \cap(\alpha(m S) \times \alpha(m S))=I_{\alpha(m s)}$, so $1_{M} \in B_{\alpha m}$. Then $\alpha m \in B_{\beta m} \beta m$, so there exists $\sigma \in \mathrm{B}_{\beta \mathrm{m}}$ such that $\alpha=\sigma \beta$.
$(4 \rightarrow 1)$ Let $\beta=\mathrm{i}_{\mathrm{mS}}$ be the inclusion map of mS .
(2-10) Proposition : Let $M_{s}$ be pseudo principally injective $S$-system with $T=\operatorname{End}\left(M_{s}\right)$. Then, for $\alpha \in T$, we have $: \mathrm{S}_{(\alpha, \mathrm{m})}=\mathrm{B}_{\alpha \mathrm{m}} \alpha \cup \ell_{\mathrm{T}}(\mathrm{mS} \times \mathrm{mS}), \forall \mathrm{m} \in \mathrm{M}_{\mathrm{s}}$.
Proof :Let $\beta \in \mathrm{S}_{(\alpha, \mathrm{m})}$, this means $\beta \in \mathrm{T}$ and $\operatorname{ker} \beta \cap(\mathrm{mS} \times \mathrm{mS})=\operatorname{ker} \alpha \cap(\mathrm{mS} \times \mathrm{mS})$. We claim that $\gamma_{\mathrm{s}}(\alpha \mathrm{m})=$ $\gamma_{\mathrm{s}}(\beta \mathrm{m})$. In fact, if $(\mathrm{s}, \mathrm{t}) \in \gamma_{\mathrm{s}}(\alpha \mathrm{m})$, then $\alpha(\mathrm{ms})=\alpha(\mathrm{mt})$ which implies $(\mathrm{ms}, \mathrm{mt}) \in \operatorname{ker} \alpha \cap(\mathrm{mS} \times \mathrm{mS})$ and sinceker $\beta \cap$ $(\mathrm{mS} \times \mathrm{mS})=\operatorname{ker} \alpha \cap(\mathrm{mS} \times \mathrm{mS})$ by the proof. So , $(\mathrm{ms}, \mathrm{mt}) \in \operatorname{ker} \beta \cap(\mathrm{mS} \times \mathrm{mS})$ which implies $\beta(\mathrm{ms})=\beta(\mathrm{mt})$ and then $\beta(\mathrm{m}) \mathrm{s}=\beta(\mathrm{m}) \mathrm{t}$. Thus $(\mathrm{s}, \mathrm{t}) \in \gamma_{\mathrm{s}}(\beta \mathrm{m})$.Hence, $\gamma_{\mathrm{s}}(\alpha \mathrm{m}) \subseteq \gamma_{\mathrm{s}}(\beta \mathrm{m})$, similarly we have $\gamma_{\mathrm{s}}(\beta \mathrm{m}) \subseteq \gamma_{\mathrm{s}}(\alpha \mathrm{m})$ and then we obtain $\gamma_{s}(\alpha m)=\gamma_{s}(\beta m)$. Then, we have $\beta \in A_{\alpha m}$. Since $A_{\alpha m}=B_{\alpha m} \alpha m$ (by proposition (2-9)), so $\beta \in B_{\alpha m} \alpha m$ and since $\beta(\mathrm{ms})=\beta(\mathrm{mt})$, where $\beta \in \mathrm{T}$, thus $\beta \in \ell_{\mathrm{T}}(\mathrm{mS} \times \mathrm{mS})$ and then $\beta \in \mathrm{B}_{\alpha \mathrm{m}} \alpha \cup \ell_{\mathrm{T}}(\mathrm{mS} \times \mathrm{mS})$. This means $\mathrm{S}_{(\alpha, \mathrm{m})} \subseteq \mathrm{B}_{\alpha \mathrm{m}} \alpha \cup \ell_{\mathrm{T}}(\mathrm{mS} \times \mathrm{mS}) \ldots(1)$. Conversely, let $\beta \in \mathrm{B}_{\alpha \mathrm{m}} \alpha \cup \ell_{\mathrm{T}}(\mathrm{mS} \times \mathrm{mS})$, so $\beta \in \mathrm{B}_{\alpha \mathrm{m}} \alpha$ or $\beta \in \ell_{\mathrm{T}}(\mathrm{mS} \times \mathrm{mS})$ . If $\beta \in \ell_{\mathrm{T}}(\mathrm{mS} \times \mathrm{mS})$, so $\beta \in$ Tand $\beta(\mathrm{ms})=\beta(\mathrm{mt})$. If $\beta \in \mathrm{B}_{\alpha} \alpha$, so there exists $\varphi \in \mathrm{B}_{\alpha}$ such that $\beta=\varphi \mathrm{o} \alpha$. Also , $\operatorname{ker} \varphi \cap(\alpha(\mathrm{mS}) \times \alpha(\mathrm{mS}))=$ and $\operatorname{ker} \beta \cap(\alpha(\mathrm{mS}) \times \alpha(\mathrm{mS}))=\mathrm{I}_{\alpha(\mathrm{mS})}$. Now, if(ms, mt) $\in \operatorname{ker} \varphi \alpha \cap(\mathrm{mS} \times \mathrm{mS})$, then $\varphi \alpha(\mathrm{ms})=\varphi \alpha(\mathrm{mt})$. Hence $(\alpha(\mathrm{ms}), \alpha(\mathrm{mt})) \in \operatorname{ker} \varphi \cap(\alpha(\mathrm{mS}) \times \alpha(\mathrm{mS}))=\mathrm{I}_{\alpha}$. This implies that (ms, mt) $\in \operatorname{ker} \alpha \cap$ $(\mathrm{mS} \times \mathrm{mS})$. Thus, $\operatorname{ker} \beta \cap(\mathrm{mS} \times \mathrm{mS}) \subseteq \operatorname{ker} \alpha \cap(\mathrm{mS} \times \mathrm{mS})(1)$. If $(\mathrm{ms}, \mathrm{mt}) \in \operatorname{ker} \alpha \cap(\mathrm{mS} \times \mathrm{mS})$, so $\alpha(\mathrm{ms})=\alpha(\mathrm{mt})$, since $\varphi \in \mathrm{T}$ and it is well-defined, so $\varphi \alpha(\mathrm{ms})=\varphi \alpha(\mathrm{mt})$ which implies $\beta(\mathrm{ms})=\beta(\mathrm{mt})$ and then (ms, mt$) \in \operatorname{ker} \beta \cap$ $(\mathrm{mS} \times \mathrm{mS})$.Thus, $\operatorname{ker} \alpha \cap(\mathrm{mS} \times \mathrm{mS}) \subseteq \operatorname{ker} \beta \cap(\mathrm{mS} \times \mathrm{mS}) \ldots(2)$. From (1) and (2), we have $\operatorname{ker} \alpha \cap(\mathrm{mS} \times \mathrm{mS})=$ $\operatorname{ker} \beta \cap(\mathrm{mS} \times \mathrm{mS})$ and then $\beta \in \mathrm{S}_{(\alpha, \mathrm{m})}$.
(2-11) Proposition: Let $M_{s}$ be pseudo principally injective S-systemwith $T=\operatorname{End}\left(M_{s}\right)$ and $\alpha \in T, m \in M_{s}$. Then:
$\alpha \in B_{m}$ if and only if $B_{m}=B_{\alpha \mathrm{m}} \alpha \cup \ell_{\mathrm{T}}(\mathrm{mS} \times \mathrm{mS})$.
Proof : $\Rightarrow$ ) Let $\alpha \in B_{m}$ and $f \in S_{(\alpha, m)}$, so $\operatorname{kerf} \cap(m S \times m S)=\operatorname{ker} \alpha \cap(m S \times m S)$, but $\operatorname{ker} \alpha \cap(m S \times m S)=i_{m S}$, hence kerf $\cap(m S \times m S)=i_{m S}$, which implies $f \in B_{m}$.Thus, $S_{(\alpha, m)}=B_{m}$, so by proposition (2-10) $B_{m}=B_{\alpha m} \alpha \cup$ $\ell_{\mathrm{T}}(\mathrm{mS} \times \mathrm{mS})$
$\Leftarrow)$ Assume that $\mathrm{B}_{\mathrm{m}}=\mathrm{B}_{\alpha \mathrm{m}} \alpha \cup \ell_{\mathrm{T}}(\mathrm{mS} \times \mathrm{mS})$ and $\alpha \in \mathrm{T}, \alpha \notin \mathrm{B}_{\mathrm{m}}$. Then, we have ker $\alpha \cap(\mathrm{mS} \times \mathrm{mS}) \neq \mathrm{I}_{\mathrm{mS}}$, so there exists $(\mathrm{ms}, \mathrm{mt}) \in \operatorname{ker} \alpha \cap(\mathrm{mS} \times \mathrm{mS})$ withms $\neq \mathrm{mt}$, then $\alpha(\mathrm{ms})=\alpha(\mathrm{mt})$. Since $1_{\mathrm{M}} \in \mathrm{B}_{\mathrm{m}}$, so $\operatorname{kerI}_{\mathrm{M}} \cap(\mathrm{mS} \times \mathrm{mS})=\mathrm{I}_{\mathrm{mS}}$. But, since $S_{(\alpha, m)}=B_{m}=B_{\alpha m} \alpha \cup \ell_{T}(m S \times m S)$, hence $I_{M} \in S_{(\alpha, m)}$, and then $\operatorname{ker} \alpha \cap(m S \times m S)=\operatorname{kerI}_{M} \cap$ $(\mathrm{mS} \times \mathrm{mS})$. Thus, ker $\alpha \cap(\mathrm{mS} \times \mathrm{mS})=\mathrm{I}_{\mathrm{mS}}$ which implies $\mathrm{ms}=\mathrm{mt}$ and this is a contradiction with $\mathrm{ms} \neq \mathrm{mt}$. So $\alpha \in B_{m}$ implies a contradiction.

Recall that $\operatorname{Soc}_{\mathbf{N}}\left(\mathbf{M}_{\mathrm{s}}\right)$ represent homogeneous component of $\operatorname{Soc}\left(\mathrm{M}_{\mathrm{s}}\right)$ containing N . Thus, we denote $\operatorname{Soc}_{N}\left(M_{s}\right):=\cup\left\{X\right.$ be subsystem of $\left.M_{s} \mid X \cong N\right\}[6]$.
(2-12) Proposition: Let $M_{s}$ be pseudo principally injective $S$-system with $T=\operatorname{End}\left(M_{s}\right)$. Then :
(1) If $N$ is a simple subsystem of $M_{s}$, then $\operatorname{Soc}_{N}\left(M_{s}\right)=T N$.
(2) If $n S$ is a simple $S$-system, $n \in M_{s}$. Then, Tn is a simple T- system .
(3) $\operatorname{Soc}\left(M_{s}\right)=\operatorname{Soc}\left({ }_{T} M\right)$.

Proof :(1) Let $N_{1} \subseteq \operatorname{Soc}_{N}\left(M_{s}\right)$, and $\mathrm{f}: \mathrm{N} \rightarrow \mathrm{N}_{1}$ be an isomorphism, where $\mathrm{N}_{1} \subseteq \mathrm{M}_{\mathrm{s}}$. If $\mathrm{N}=\mathrm{nS}$, then $\gamma_{\mathrm{s}}(\mathrm{n})=$ $\gamma_{s}(f(n))$. Since, if $(s, t) \in \gamma_{s}(n)$, then $n s=n t$, since $f$ is well-defined, so $f(n s)=f(n t)$. This implies $f(n) s=f(n) t$ and $(\mathrm{s}, \mathrm{t}) \in \gamma_{\mathrm{s}}(\mathrm{f}(\mathrm{n}))$, so $\gamma_{\mathrm{s}}(\mathrm{n}) \subseteq \gamma_{\mathrm{s}}(\mathrm{f}(\mathrm{n}))$. Conversely, let $(\mathrm{s}, \mathrm{t}) \in \gamma_{\mathrm{s}}(\mathrm{f}(\mathrm{n}))$, so $\mathrm{f}(\mathrm{ns})=\mathrm{f}(\mathrm{nt})$. Since f is monomorphism, so $\mathrm{ns}=\mathrm{nt}$. This implies that $(\mathrm{s}, \mathrm{t}) \in \gamma_{\mathrm{s}}(\mathrm{n})$, so $\gamma_{\mathrm{s}}(\mathrm{f}(\mathrm{n})) \subseteq \gamma_{\mathrm{s}}(\mathrm{n})$. Thus $\gamma_{\mathrm{s}}(\mathrm{f}(\mathrm{n}))=\gamma_{s}(n)$, which implies $\mathrm{B}_{\mathrm{n}} \bullet \mathrm{n}=\mathrm{B}_{\mathrm{fn}} \bullet \mathrm{fn}$ by proposition(2-9). Thus $f n \in B_{n} \bullet n \subseteq T n \subseteq T N$. Hence, if $g$ is an extension of $f$ to $T$, we have $N_{1}=f(n S)=g(n S) \in T$. Thus $\operatorname{Soc}_{\mathrm{N}}\left(\mathrm{M}_{\mathrm{s}}\right) \subseteq \mathrm{TN}$. The other inclusion always holds, this means $\mathrm{TN} \subseteq \operatorname{Soc}_{\mathrm{N}}\left(\mathrm{M}_{\mathrm{s}}\right)$, since for $\alpha \in \mathrm{TN}, \alpha: \mathrm{N} \rightarrow \mathrm{N}$ be identity map and since $N \cong N$ and $N$ be subsystem of $M_{s}$, so $\alpha(N)=N \subseteq \operatorname{Soc}_{N}\left(M_{s}\right)$ which implies $T N \subseteq$ $\operatorname{Soc}_{\mathrm{N}}\left(\mathrm{M}_{\mathrm{s}}\right)$.Therefore, $\operatorname{Soc}_{\mathrm{N}}\left(\mathrm{M}_{\mathrm{s}}\right)=\mathrm{TN}$.
(2) Let $\alpha \in T, \alpha: M_{s} \rightarrow M_{s}$, since $M_{s}$ is pseudo principally injective, so $\alpha_{1}\left(=\left.\alpha\right|_{n S}\right): n S \rightarrow M_{s}$ is S-monomorphism . Since nS is simple subsystem of $\mathrm{M}_{\mathrm{s}}$, so $\alpha_{1}: \mathrm{nS} \rightarrow \alpha_{1}(\mathrm{nS})$ is an S -isomorphism. Thus, let $\sigma: \alpha_{1}(\mathrm{nS}) \rightarrow \mathrm{nS}$ be its inverse . For $\Theta \neq \alpha n \in \operatorname{Tn}$ and if $g \in T$ extends $\sigma$, then $g\left(\alpha_{1}(n)\right)=\sigma\left(\alpha_{1}(n)\right)=n \in T \alpha n$. Therefore, $T n \subseteq T \alpha n$. Then, $T n=T \alpha n$ whence $\mathrm{T} \alpha \mathrm{n} \subseteq \mathrm{Tn}$, such that if we take $\beta \alpha \mathrm{n} \in \mathrm{T} \alpha \mathrm{n}$, and $\beta \in \mathrm{T}$, then , since $\beta \in \mathrm{T}$ and $\alpha \in \mathrm{T}$, so $\beta \alpha \in \mathrm{T}$. Thus, $\beta \alpha \mathrm{n} \in \mathrm{Tn}$ and $\mathrm{T} \alpha \mathrm{n} \subseteq \mathrm{Tn}$.
(3) This follows by (2).
(2-13) Proposition :Let $M_{s}$ be pseudo principally injective $S$-system with $T=\operatorname{End}\left(M_{s}\right)$. Then:
(1) If $N$ and $K$ are isomorphic principal subsystem of $M_{s}$ and $K$ is a retract of $M_{s}$, then $N$ is also a retract of $M_{s}$.

## (2) Every pseudo principally injective has $\mathrm{C}_{2}$-condition

Proof: It is obvious that (1) implies (2), so it is enough to prove (1). Let $N$ be a subsystem of $M_{s}$ and $i$ be the inclusion map of $N$ into $M_{s}$. It is enough to prove that inclusion map split. Let $\alpha: N \rightarrow K$ be an S-isomorphism. Since $K$ is a retract of $M_{s}$, so there exists S-homomorphims $\pi: M_{s} \rightarrow K$ and $j: K \rightarrow M_{s}$ projection and injection map respectively . Let $i_{1}$ be the inclusion map of $N$ into $M_{s}$ and $\alpha^{-1}$ be the inverse map of $\alpha$ (since $\alpha$ is $S$-isomorphism). Since $M_{s}$ is pseudo principally injective ,so there exists $S$-homomorphism $\bar{\alpha}: \mathrm{M}_{\mathrm{s}} \rightarrow \mathrm{M}_{\mathrm{s}}$ which is extension of $\alpha$ (this means $\bar{\alpha}$ oi= jo $\alpha$ ).Now, define $\sigma\left(=\alpha^{-1} \pi \bar{\alpha}\right): M_{s} \rightarrow \mathrm{~N}$. If $\mathrm{n} \in \mathrm{N}$, write $\alpha(\mathrm{n})=\mathrm{k} \in \mathrm{K}$, hence $\sigma \mathrm{n}=\alpha^{-1}(\pi \bar{\alpha}(\mathrm{n})) \in \mathrm{N}$, then $\sigma \mathrm{n}=\alpha^{-1}(\pi \bar{\alpha}(\mathrm{n}))=\alpha^{-}$ ${ }^{1}(\pi \alpha(\mathrm{n}))=\alpha^{-1}(\pi(\mathrm{k}))=\alpha^{-1}(\mathrm{k})=\alpha^{-1}(\alpha(\mathrm{n}))=\mathrm{n}$. Thus, $\sigma \mathrm{n}=\mathrm{n}$ and inclusion split, since $\sigma 0 \mathrm{i}=\mathrm{I}_{\mathrm{N}}$.

Recall that an $S$-system $M_{s}$ is called principally self-generator if every $x \in M_{s}$, there is an S-homomorphism $f$ : $M_{s} \rightarrow x S$ such that $x=f\left(x_{1}\right)$ for $x_{1} \in M_{s}[6]$.
(2-14) Lemma: Let $M_{s}$ be principally self-generator. Then, every principal subsystem is of the form mS, where $\gamma_{\mathrm{s}}\left(\mathrm{m}_{0}\right) \subseteq \gamma_{\mathrm{s}}(\mathrm{m})$ and $\mathrm{M}_{\mathrm{s}}=\mathrm{m}_{0} \mathrm{~S}$.
Proof: Let $M_{s}=m_{0} S$ be a principal $S$-system and $n S$ be a principal subsystem of $M_{s}$, since $M_{s}$ is self -generator, then for $n \in M_{s}$, there is an S-homomorphism $\alpha: M_{s} \rightarrow n S$, so $n=\alpha\left(m_{1}\right)$ for some $m_{1} \in M_{s}$. Then, $n t=\alpha\left(m_{1}\right) t=\alpha\left(m_{1} t\right)=$ $\alpha\left(\mathrm{m}_{0} \mathrm{st}\right)$, which implies that $\alpha$ is onto. Thus, $\operatorname{Im} \alpha=\mathrm{nS}=\alpha\left(\mathrm{m}_{0}\right) \mathrm{S}=\mathrm{mS}$ where $\mathrm{m}=\alpha\left(\mathrm{m}_{0}\right)$. Now, $\forall(\mathrm{s}, \mathrm{t}) \in \gamma_{\mathrm{s}}\left(\mathrm{m}_{0}\right)$ implies $\mathrm{m}_{0} \mathrm{~s}=\mathrm{m}_{0} \mathrm{t}$ and then $\mathrm{ms}=\alpha\left(\mathrm{m}_{0}\right) \mathrm{s}=\alpha\left(\mathrm{m}_{0} \mathrm{~s}\right)=\alpha\left(\mathrm{m}_{0} \mathrm{t}\right)=\alpha\left(\mathrm{m}_{0}\right) \mathrm{t}=\mathrm{mt}$. This means that $\mathrm{m} \in \ell_{\mathrm{M}}\left(\gamma_{\mathrm{s}}\left(\mathrm{m}_{0}\right)\right)$ which implies that $\gamma_{\mathrm{s}}\left(\mathrm{m}_{0}\right)=\gamma_{\mathrm{s}}\left(\ell_{\mathrm{M}}\left(\gamma_{\mathrm{s}}\left(\mathrm{m}_{0}\right)\right)\right) \subseteq \gamma_{\mathrm{s}}(\mathrm{m})$.
(2-15) Proposition: Let $M_{s}$ be a principal system which is a principal self-generator and let $T=E n d\left(M_{s}\right)$. The following conditions are equivalent:
(1) $M_{s}$ is pseudo principally injective;
(2) $\mathrm{S}_{(\alpha, \mathrm{m})}=\mathrm{B}_{\alpha \mathrm{m}} \alpha \cup \ell_{\mathrm{T}}(\mathrm{mS} \times \mathrm{mS})$ for all $\alpha \in \mathrm{T}$ and all $\mathrm{m} \in \mathrm{M}_{\mathrm{s}}$;
(3) If $A_{\alpha m}=A_{\beta m}$, then $\beta \in B_{\alpha m} \alpha \cup \ell_{\mathrm{T}}(\mathrm{mS} \times \mathrm{mS})$.

Proof: $(1 \rightarrow 2)$ By proposition (2-10).
$(2 \rightarrow 3)$ Let $A_{\alpha m}=A_{\beta m}$, then $\gamma_{s}(\alpha m)=\gamma_{s}(\beta m)$. Let $(x, y) \in \operatorname{ker} \alpha$, so $\alpha(x)=\alpha(y)$ where $x, y \in M_{s}=m S$. Let $x=m s_{1}$, and $y=\mathrm{ms}_{2}$, then $\alpha(\mathrm{m}) \mathrm{s}_{1}=\alpha(\mathrm{m}) \mathrm{s}_{2}$, so $\left(\mathrm{s}_{1}, \mathrm{~s}_{2}\right) \in \gamma_{\mathrm{s}}(\alpha(\mathrm{m}))=\gamma_{\mathrm{s}}(\beta(\mathrm{m}))$. This implies $\beta(\mathrm{m}) \mathrm{s}_{1}=\beta(\mathrm{m}) \mathrm{s}_{2}$ and then $\beta\left(\mathrm{ms}_{1}\right)$ $=\beta\left(\mathrm{ms}_{2}\right)$, this means $\beta(\mathrm{x})=\beta(\mathrm{y})$ and $(\mathrm{x}, \mathrm{y}) \in \operatorname{ker} \beta$. Thus $\operatorname{ker} \alpha \subseteq \operatorname{ker} \beta$. For the other direction, let $(\mathrm{x}, \mathrm{y}) \in \operatorname{ker} \beta$, so $\beta(\mathrm{x})$ $=\beta(y)$ since $x, y \in M_{s}=m S$. Let $x=m s_{1}$, and $y=m s_{2}$. Thus $\beta(m) s_{1}=\beta(m) s_{2}$ and then $\left(s_{1}, s_{2}\right) \in \gamma_{s}(\beta(m))=\gamma_{s}(\alpha(m))$ . This implies $\alpha(\mathrm{m}) \mathrm{s}_{1}=\alpha(\mathrm{m}) \mathrm{s}_{2}$, then $\alpha\left(\mathrm{ms}_{1}\right)=\alpha\left(\mathrm{ms}_{2}\right)$, so $\alpha(\mathrm{x})=\alpha(\mathrm{y})$ which implies ( $\left.\mathrm{x}, \mathrm{y}\right) \in \operatorname{ker} \alpha$, thus $\operatorname{ker} \alpha=\operatorname{ker} \beta$. So , $\operatorname{ker} \beta \cap(\mathrm{mS} \times \mathrm{mS})=\operatorname{ker} \alpha \cap(\mathrm{mS} \times \mathrm{mS})$ which implies $\mathrm{S}_{(\alpha, \mathrm{m})}=\mathrm{S}_{(\beta, \mathrm{m})}$, so by (2), we have $\mathrm{B}_{\alpha \mathrm{m}} \alpha \cup \ell_{\mathrm{T}}(\mathrm{mS} \times \mathrm{mS})=$ $B_{\beta m} \beta \cup \ell_{\mathrm{T}}(\mathrm{mS} \times \mathrm{mS})$. Since $1_{\mathrm{M}} \in \mathrm{B}_{\beta(\mathrm{m})}$. This means $\beta=1_{\mathrm{M}} \cdot \beta \in \mathrm{B}_{\beta \mathrm{m}} \beta$, so $\beta \in \mathrm{B}_{\beta \mathrm{m}} \beta \cup \ell_{\mathrm{T}}(\mathrm{mS} \times \mathrm{mS})=\mathrm{B}_{\alpha \mathrm{m}} \alpha \cup$ $\ell_{\mathrm{T}}(\mathrm{mS} \times \mathrm{mS})$, this implies $\beta \in \mathrm{B}_{\alpha \mathrm{m}} \alpha \cup \ell_{\mathrm{T}}(\mathrm{mS} \times \mathrm{mS})$. Also , $\alpha \in \mathrm{B}_{\beta \mathrm{m}} \beta \cup \ell_{\mathrm{T}}(\mathrm{mS} \times \mathrm{mS})$.
$(3 \rightarrow 1)$ Assume that $\mathrm{f}: \mathrm{mS} \rightarrow \mathrm{M}_{\mathrm{s}}$ be an S-homomorphism. Since $\mathrm{M}_{\mathrm{s}}$ is principal, so there exists $\mathrm{m}_{0} \in \mathrm{M}_{\mathrm{s}}$ such that $\mathrm{M}_{\mathrm{s}}=$ $m_{0} S$ and $\alpha: M_{s} \rightarrow m S$ with $\alpha\left(m_{0}\right)=m$, where $\gamma_{s}\left(m_{0}\right) \subseteq \gamma_{s}(m)$. Again since $M_{s}$ is principal self-generator, so there exists $\quad \beta \quad \mathrm{M}_{\mathrm{s}} \rightarrow \mathrm{f}(\mathrm{m}) \mathrm{S}$ such that $: \mathrm{f}(\mathrm{m})=\beta\left(\mathrm{m}_{0}\right)$, where $\mathrm{M}_{\mathrm{s}}=\mathrm{m}_{0} \mathrm{~S}$ ...(1) .
Since f is S -monomorphism, so $\gamma_{s}(\mathrm{f}(\mathrm{m}))=\gamma_{\mathrm{s}}(\mathrm{m})$. In fact, since, if $(\mathrm{s}, \mathrm{t}) \in \gamma_{\mathrm{s}}(\mathrm{f}(\mathrm{m}))$, so $\mathrm{f}(\mathrm{ms})=\mathrm{f}(\mathrm{mt})$, since f is monomorphism, so $\mathrm{ms}=\mathrm{mt}$ which implies $(\mathrm{s}, \mathrm{t}) \in \gamma_{\mathrm{s}}(\mathrm{m})$ and then $\gamma_{\mathrm{s}}(\mathrm{f}(\mathrm{m})) \subseteq \gamma_{\mathrm{s}}(\mathrm{m})$. For the other direction, let $(s, t) \in \gamma_{s}(m)$, so $m s=m t$. Since $f$ is well-defined, so $f(m s)=f(m t)$. Thus $f(m) s=f(m) t$ which implies $(s, t) \in$ $\gamma_{s}(f(m))$ and then $\gamma_{s}(m) \subseteq \gamma_{s}(f(m))$. Thus, $\gamma_{s}(f(m))=\gamma_{s}(m)$. This implies $\gamma_{s}\left(\beta\left(m_{0}\right)\right)=\gamma_{s}\left(\alpha\left(m_{0}\right)\right)$. This means $\operatorname{ker} \alpha=\operatorname{ker} \beta$. In fact, for $(x, y) \in \operatorname{ker} \alpha$, this implies $\alpha(x)=\alpha(y)$ where where $x, y \in M_{s}=m_{0} S$. Let $x=m_{0} s_{1}$, and $y=m_{0} s_{2}$, then $\alpha\left(m_{0} s_{1}\right)=\alpha\left(m_{0} s_{2}\right)$ which implies $\alpha\left(m_{0}\right) s_{1}=\alpha\left(m_{0}\right) s_{2}$, so $\left(s_{1}, s_{2}\right) \in \gamma_{s}\left(\alpha\left(m_{0}\right)\right)=\gamma_{s}\left(\beta\left(m_{0}\right)\right)$ by the proof. This implies $\beta\left(m_{0}\right) s_{1}=\beta\left(m_{0}\right) s_{2}$ and then $\beta\left(m_{0} s_{1}\right)=\beta\left(m_{0} s_{2}\right)$, this means $\beta(x)=\beta(y)$ and $(x, y) \in \operatorname{ker} \beta$. Thus ker $\alpha \subseteq \operatorname{ker} \beta$. Similarly for other direction, thus $\operatorname{ker} \alpha=\operatorname{ker} \beta . \operatorname{So}, \operatorname{ker} \alpha \cap\left(m_{0} S \times m_{0} S\right)=\operatorname{ker} \beta \cap\left(m_{0} S \times m_{0} S\right)$ which implies $S_{\left(\alpha, \mathrm{m}_{0}\right)}=\mathrm{S}_{\left(\beta, \mathrm{m}_{0}\right)}$ and $\mathrm{A}_{\alpha \mathrm{m}_{0}}=\mathrm{A}_{\beta \mathrm{m}_{0}}$, so by (3) we have $\beta \in \mathrm{B}_{\alpha \mathrm{m}_{0}} \alpha \cup \ell_{\mathrm{T}}\left(\mathrm{m}_{0} \mathrm{~S} \times \mathrm{m}_{0} \mathrm{~S}\right)$. Thus, either $\beta \in \mathrm{B}_{\alpha \mathrm{m}_{0}} \alpha$ or $\beta \in \ell_{\mathrm{T}}\left(\mathrm{m}_{0} \mathrm{~S} \times \mathrm{m}_{0} \mathrm{~S}\right)$. If $\beta \in \mathrm{B}_{\alpha \mathrm{m}_{0}} \alpha$, then there exists S -homomorphism $\varphi \in \mathrm{B}_{\alpha \mathrm{m}_{0}}$ which implies $\varphi \in \mathrm{T}$ and $\beta=\varphi \alpha$. Thus, $\varphi(\mathrm{m})=\varphi\left(\alpha\left(\mathrm{m}_{0}\right)\right)=\beta\left(\mathrm{m}_{0}\right)$ and by (1) $\beta\left(\mathrm{m}_{0}\right)=\mathrm{f}(\mathrm{m})$, so $\left.\varphi\right|_{\mathrm{mS}}=\mathrm{f}$, so $\mathrm{M}_{\mathrm{s}}$ is pseudo principally injective system. If $\beta \in \ell_{\mathrm{T}}\left(\mathrm{m}_{0} \mathrm{~S} \times \mathrm{m}_{0} \mathrm{~S}\right)$, so $\beta \in \ell_{\mathrm{T}}\left(\mathrm{M}_{\mathrm{s}} \times \mathrm{M}_{\mathrm{s}}\right.$ ) which implies $\beta \in \operatorname{Tand} \forall(\mathrm{x}, \mathrm{y}) \in \mathrm{M}_{\mathrm{s}} \times \mathrm{M}_{\mathrm{s}}$, we have $\beta(\mathrm{x})=\beta(\mathrm{y}) \forall(\mathrm{x}, \mathrm{y}) \in$ $M_{s}$. This implies $\operatorname{ker} \beta=M_{s} \times M_{s}$ and then $\beta=0$ which implies
$\mathrm{f}=0$ and this is a contradiction.

## 3- Relation Between Pseudo PQ-Injective S-Systems With Other Classes of Injectivity:

It is well known that each PQ-injective system is pseudo PQ-injective. To show under which conditions the converse is true, we need the following concepts and some propositions and lemmas.

Recall that a subsystem $N$ of an S-system $M_{s}$ is called (pseudo)stable if $f(N) \subseteq N$ for each S-homomorphism (Smonomorphism) $\mathrm{f}: \mathrm{N} \rightarrow \mathrm{M}_{\mathrm{s}}$. An S-system $\mathrm{M}_{\mathrm{s}}$ is called fully (pseudo) stable if each subsystem of $\mathrm{M}_{\mathrm{s}}$ is (pseudo) stable [12], [8]. It is clear that every stable subsystem is pseudo stable and hence every fully stable S-system is fully pseudo stable. It was proved that
every fully pseudo stable $S$-system is pseudo $P Q$-injective.
Recall that an S-system $\mathrm{M}_{\mathrm{s}}$ is multiplication if each subsystem of $\mathrm{M}_{\mathrm{s}}$ is of the form MI, for some right ideal I of S . This is equivalent to saying that every principal subsystem is of this form [11] .
(3-1) Proposition :Let $M_{s}$ be multiplication $S$-system. Then, $M_{s}$ is fully pseudo stable if and only if $M_{s}$ is pseudo PQinjective S-system.

Proof: Let mS be principal subsystem of an $S$-system $\mathrm{M}_{\mathrm{s}}$ and $\alpha: \mathrm{mS} \rightarrow \mathrm{M}_{\mathrm{s}}$ be an S-monomorphism, where $m \in \mathrm{M}_{\mathrm{s}}$. Then, since $M_{s}$ is pseudo PQ-injective, so $\alpha$ extends to an S-homomorphism $\beta: M_{s} \rightarrow M_{s}$. Since $M_{s}$ is multiplication system, so there is an ideal I of S such that $\mathrm{mS}=\mathrm{MI}$. Hence, $\alpha(\mathrm{mS})=\beta(\mathrm{mS})=\beta(\mathrm{MI})=\beta(\mathrm{M}) \mathrm{I} \subseteq \mathrm{MI}=\mathrm{mS}$. ThusM $\mathrm{T}_{\mathrm{s}}$ is fully pseudo stable.

Now, we give under which conditions on pseudo PQ-injective systems to be PQ-injective. But, before this we need the following propositions :
(3-2) Proposition[8]: An S-system $M_{s}$ is fully stable if and only if $M_{s}$ is fully pseudo-stable and $\mathrm{xS} \cong \operatorname{Hom}\left(\mathrm{xS}, \mathrm{M}_{\mathrm{s}}\right)$ for each x in $\mathrm{M}_{\mathrm{s}}$.
(3-3) Proposition[6] : Let $S$ be a commutative monoid and $M_{s}$ be a multiplication S-system. Then $M_{s}$ is fully stable if and only ifM ${ }_{s}$ is PQ-injective S-system .
(3-4) Proposition :Let $M_{s}$ be multiplication $S$-system, where $S$ is a commutative monoid and $x S \cong H o m\left(x S, M_{s}\right)$ for each $x$ in $M_{s}$. If $M_{s}$ is pseudo PQ-injective system, then $M_{s}$ is PQ-injective .
Proof: Assume that $M_{s}$ is pseudo PQ-injective system. Since $M_{s}$ is multiplication system, so $M_{s}$ is fully pseudo stable by proposition (3-1). Since $\mathrm{xS} \cong \operatorname{Hom}\left(x S, M_{s}\right)$, so by proposition (3-2), $M_{s}$ is fully stable system. Again since $M_{s}$ is multiplication system, so by proposition(3-3) $\mathrm{M}_{\mathrm{s}}$ is PQ-injective system .

It is clear that every quasi injective system is pseudo PQ-injective system (and hence PQ-injective ), but the converse is not true in general. For the converse, we need the following proposition :
(3-5)Proposition[6]: Let $M_{s}$ be multiplication S-system. If $M_{s}$ is PQ-injective, then $M_{s}$ is quasi injective .
(3-6) Proposition :Let $M_{s}$ be multiplication $S$-system, where $S$ is a commutativemonoid and $x S \cong \operatorname{Hom}\left(x S, M_{s}\right)$ for each $x$ in $M_{s}$. If $M_{s}$ is pseudo PQ-injective $S$-system, then $M_{s}$ is quasi injective .
Proof: By proposition (3-4) and proposition (3-5) .
At the same time, we can give another conditions to versus pseudo PQ-injective $S$-systems with $P Q$-injective , but we need the following concept:
(3-7) Proposition :Let $M_{s}$ be a cog-reversible nonsingular S-system with $\ell_{M}(s)=\Theta, \forall \mathrm{s} \in \mathrm{S}$.IfM $\mathrm{I}_{\mathrm{s}}$ is pseudo PQinjective, then $\mathrm{M}_{\mathrm{s}}$ is PQ-injective.
Proof : Let $N$ be principal subsystem of $S$-system $M_{s}$ and $f$ be S-homomorphism from $N$ into $M_{s}$. If f is Smonomorphism, then there is nothing to prove. So assume $f$ is not S-monomorphism. Then, by using the proof of theorem(3.2.17), we get the required. This means thatM $\mathrm{M}_{\mathrm{s}}$ is PQ -injective S -system .

The following proposition explain under which conditions on pseudo PQ-injective system to beingpseudo QPinjective and the proof is similar to proposition(2-22) in [7] by replacing S-homomorphisms by S-monomorphism.
(3-8) Proposition :Let $M_{s}$ be an S-system which is principal and principal self-generator. Then,$M_{s}$ is pseudo PQinjective S-system if and only ifM $_{s}$ is pseudo QP-injective.
Proof : $\Leftarrow)$ Let $N$ be cyclic subsystem of $M_{s}$ and f be S-monomorphism from $N$ into $M_{s}$. Since $M_{s}$ is principal selfgenerator, so there exists some $\alpha: M_{s} \rightarrow m S$, such that $m=\alpha\left(m_{1}\right), \forall m \in M_{s}$. This means $\alpha$ is S-epimorphism, thus $N$ is $M_{s}$-cyclic subsystem of $M_{s}$. Since $M_{s}$ is pseudo QP-injective system, so $f$ can be extended to S-homomorphism $g: M_{s}$ $\rightarrow M_{s}$, such that goi $=f$, where $i$ be the inclusion map of $N$ into $M_{s}$, therefore $M_{s}$ is pseudo PQ-injective system .
$\Rightarrow)$ Let N be $\mathrm{M}_{\mathrm{s}}$-cyclic subsystem of an S -system $\mathrm{M}_{\mathrm{s}}$, so there exists an S-epimorphism $\alpha: \mathrm{M}_{\mathrm{s}} \rightarrow \mathrm{N}$. Since $\mathrm{M}_{\mathrm{s}}$ is principal, so $N$ is principal . Let $f$ be $S$-monomorphism from $N$ into $M_{s}$. Since $M_{s}$ is pseudo PQ-injective system, so f can be extended to $S$-homomorphism $g$ from $M_{s}$ into $M_{s}$ such that goi $=f$, where i be the inclusion map of $N$ into $M_{s}$. Thus $\mathrm{M}_{\mathrm{s}}$ is pseudo QP-injective system .
